

AgriGuide intro

Programme and data model
10th June 2026

#tap2grow

AgriGuide vision

AgriGuide's vision goes beyond label digitalisation – it is about compliance to regulation and optimizing the usage of Plant Protection Products.

Addressing Key Stakeholder Needs

AG INPUTS & INDUSTRY - CLE

- Increase **trust** in CP product safety
- **Fulfil regulatory obligation** on digital label
- Correct & up-to-date data in 1 place **single source of truth**

SOCIETY & NGOs

- Increased **transparency** and **trust**

FARMERS

- Provide **real-time** and **searchable** product **information**
- **Reduce complexity** having an easy and **machine-readable access** to **compliance instructions**
- Solution to help PPPs use recording

AG EQUIPMENT & SOFTWARE

- **Unique normalised** data source
- Easy to **integrate**
- Provide **automatic spray protocols**

EUROPEAN COMMISSION & MEMBER STATE AUTHORITIES

- Ease farmer to **document** actual use of PPPs
- Data-driven **proof** that EU wide targets are achieved

Digitised label information – three broad use-cases

1. Review/Approve Interaction – Regulator/Registrant

- Process currently uses an electronic label – usually a PDF – with limited digital information
- A digital label offers many benefits with an information structure for labels supporting: content, comments, revisions, versioning, comparisons

Pre-approval –
registrant &
regulator dialogue

2. Use by farmers/growers, software, machinery

- Digital label – granular digitisation, consistent vocabulary; supports farm management apps, application machine-readability, precision application, general stewardship and product handling

On-farm use -
CropLife Europe
AgriGuide focus

3. Other – analytics, downstream food supply chain, food production indices

- Using information from digital label data objects: downstream, beyond farm-gate logistics, food provenance

Post-farm activities

“machine-readability” underpins a digital label

Within AgriGuide, our ambition is to create digital labels which are **machine readable**.

According to the Official Journal of the European Union, machine readable is defined as:

*“A document should be considered to be in a machine-readable format if it is in a file format that is structured in such a way that **software applications** can **easily** identify, recognise and **extract specific data** from it.”*

Another commonly used definition of machine readable is “Data which is in a data format that can be automatically read and processed by a computer”.

More information on what constitutes machine readable can be found via the below links:

- [Official Journal of the European Union](#)
Clause 35; article 2.13; article 5
- [Open Data Handbook](#)

LABEL DEFINITIONS

Paper Label

- Print-out of electronic label (PDF or paper-label)
- Usually fold-out booklet, whereby front and back pages hold key information – especially safety statements

Printout of electronic label PDF as paper label

Electronic label

- A ‘flat’ electronic paper, usually in PDF
- Contains both text and graphic context including presentation

Specific rendering of digital label data objects as a PDF

Digital Label

- Label information is broken down into different parts and organized as dataset that can be searched.
- Similar to a paper label, but includes extra reference numbers and semantics.

Digital label data objects

Products in scope

Dimension	Product/Crop Type	In Scope
Products in scope (in line with the (EC) 1107/2009)	Conventional Pesticides (Small-molecule active ingredients for H, F, I uses)	In
	Post-harvest Pesticides (Used after harvesting crops)	In
	Non-field Crops (Apples, grapes, etc.)	In
	Biologicals (Bio-pesticides only)	In
	Non-crop uses like golf courses and railway lines	In
	SeedCare (Seed treatment by manufacturer or farmer)	In
	Adjuvants & co-packs	In
	Plant growth regulators	In

Out of Scope

- Other Biologicals (e.g. CE marked bio-stimulant products)
- Fertilisers

AgriGuide – outline of platform

The conceptual architecture overview of the AgriGuide landscape can be divided into different parts in scope for CLE

Data Model

The graph model used for AgriGuide allows us to reach the right level of granularity and to describe accurately the relationship between information in a structured manner. This stylized diagram gives an indication of the model structure:

Product Identifier and Data Carrier supported by Agriguide

Example of product Identification through scanning

Linear barcode Reading

2D barcode Reading

Labels – different packs, same content

We can have multiple combination of Formulation & Pack size on a given market as it may be required to answer to customer need, due to the quantity they need to treat their field.

For example, Starane Advanced:

Three different GTINs

- One for Starane Advanced 1L
- One for Starane Advanced 5L
- One for Starane Advanced 20L

Consequences for AgriGuide:

1. Several GTINs will point to the same label content
2. GTIN is the only link to the quantity in the container which is critical at a later stage to the spray program and its record

Batch Number Traceability Principle

Consumer Unit

All consumer unit are identified with the same information.

The GTIN is the one of the consumer unit.

Used GS1 Information

	AI	Nber of character	Format	Comments
GTIN	(01)	14	n2+n14	EAN 13 + Leading zero
Batch Number	(10)	Max. 10	n2+an..20	Max. 20 alphanumeric
Production Date	(11)	6	n2+n6	Date format = YYMMDD

Information encoded into a 2D data matrix GS1.

Could be made using:

- Thermal transfer printing on consumer Unit label
- Inkjet printed on consumer unit
- Thermal transfer printed Adhesive sticker

Use

Distributors & Retailer – Pricing / Sale record
Farmer – CPP use at farm

Trade Unit

All trade unit are identified with the same information.

The GTIN is the one of the trade unit.

Used GS1 Information

	AI	Nber of character	Format	Comments
GTIN	(01)	14	n2+n14	EAN 13 + Leading zero
Batch Number	(10)	Max. 10	n2+an..20	Max. 20 alphanumeric
Production Date	(11)	6	n2+n6	Date format = YYMMDD

Information encoded into a 2D data matrix GS1 and as an option in a linear EAN 128

Could be made using:

- Inkjet printed on trade unit side wall during production
- Thermal transfer printed Adhesive label applied on trade unit

Use

Distributors & Retailer –
Pricing / Sale record / Logistic

Logistic Unit

All trade unit are identified with a unique number called an SSCC.

The GTIN used on the pallet label is the one of the trade unit.

Used GS1 Information

	AI	Nber of character	Format	Comments
GTIN	(02)	14	n2+n14	EAN 13 + Leading zero
Nber of Trade Unit	(37)		n2+n2	Nber on logistic unit
Batch Number	(10)	Max. 10	n2+an..20	Max. 20 alphanumeric
Production Date	(11)	6	n2+n6	Date format = YYMMDD
SSCC number	(00)	18	n2+n18	

Information encoded into a 2D data matrix GS1 and several linear bar code EAN 128

The pallet will be identified using a thermal transfer printed adhesive label

Use

Manufacturer – Distributor
Pricing / Sale record / Logistic
